

PRESS RELEASE

April, 2009

European Symposium on Photocatalysis – JEP 2009

Researchers / Industrials workshop -

Cité mondiale - Bordeaux

September, 21 – 22 2009

Organized by

FFP, Fédération française de la photocatalyse and Innovalis Aquitaine

FFP, French Federation of Photocatalysis, is taking sour and is becoming FEP, European Federation of Photocatalysis, mobilizing in its wake industrials and researchers through JEP, the European days devoted to Photocatalysis.

This new technology, thanks to its success, rallies more and more scientists and manufacturers in Europe. The French federation, with its opening approach, constitutes FEP, next may 2009. It organizes with Innovalis Aquitaine as partner JEP09 that will take place in Bordeaux. Those days will speak about the last technological advances of photocatalysis involved in environment and sanitary protection.

Fédération Française de la Photocatalyse - Service Communication – Hélène CARRE

Union of proficiencies in Europe

FFP, owing to its new status, establishes its acknowledgement on a European and international level. New Belgian German Italian British and Spanish partners will come to enrich this brilliant circle with their recent findings and knowledge on photocatalysis. FFP pursues its development by federating all these talents together like manufacturers, engineers, scientists, environmental professionals or users. Through working on its identity towards international proceedings, FFP gives shape to its organization process about an economical and embryonic sector. that will be promising on the sustainable development market. Mobilizing common values and interests from all the speakers of photocatalysis, the Federation assures now the defence of a new technology in a unified way through a European approach.

JEP 2009: the congress gives the tone of gathering

JEP 2009 comes within the scope of widening and suggests to visit numerous applications of photocatalysis in various sectors, especially in air purification, water treatment, sanitary protection and recent photocatalytical materials. These days, framed on five sessions, three conferences and twenty-one oral communications are meant for scientists and manufacturers from all Europe. Architects are expected as well in this forum and will be concerned about materials and photocatalysis. The most interesting part of this emerging technology is to have use of low cost resources, fully available from nature. It applies this property mixing semi-conductor and light emission to reduce surrounding pollution. This peculiar detail on photocatalysis will give the tone to the federating matter of congress: « **strength of light working for environment** ».

The objective of these days is to gather engineers and other environmental professionals to present their last innovations and discuss future trends and prospects of photocatalysis, as far as sustainable development is concerned. These new directions concerning building and sanitary will favour and enrich debates with all the well-known European scientists and manufacturers. JEP 2009 will be the opportunity to have more informal exchanges as well with posters sessions and demonstration stands.

A website devoted to JEP 2009 is available and informs you about the forum and its organization. You can connect you on: <http://jep2009site.teamresa.biz>
